• Changes made in Sprint 3 with justification:

- Controllers were introduced and implemented in the parts that contained complex data such as the admin and customer classes, with other additional ones. Not all GUI components needed to have a controller since they were simple.
- Sample data are provided using: customers.csv, accounts.csv, and accountTypes.csv.
- Source code was refactored by removing any unused declared variables/functions,
 large commented blocks of codes that used to exist, and any unused parameters.
- Some functionalities were improved and bugs were fixed, for example: handling cases of empty text boxes.
- o All println() functions were removed.

• Structure of CSV Files:

- o customers.csv: ID Name
- o accounts.csv: accountNumber accountType balance customerID
- o accountTypes.csv: type_number type_description
